Find information on the spot without missing the fun!

Nineteen of the most interesting wrecks off the coast of Dorset in the South of England are presented in this multi media dive guide. There are photos in True Color quality of all the wrecks and the most important seaports. All the photo material was processed on high performance scanners. This means that on a good monitor the photos are of the same or even better quality than photos in books or journals. In addition to the information contained in the text and the photos, you will find graphics in which all the camera positions are marked. A single mouse click will show you immediately the wreck as seen under water at that exact spot. Furthermore, there is an extra section giving you safety instructions and information about the special equipment you will need for this area, which is not easy to dive.

The main advantage of this multi media approach is that important information on the dives sites can be presented visually in the best possible way. Even the most inexperienced computer user will have no problems with the navigation menu. Anyone who can handle a book, will also be able to handle this CD-ROM! If you wish, you can end the programme anywhere with just one or two mouse clicks. We have deliberately avoided using superfluous information that you have to scroll through and animations that you cannot get out of. Our aim was to create a completely interactive dive guide. You are the

one to decide what happens next! The programme starts directly from the CD-ROM. This means that complicated installation procedures are not necessary. Naturally there is an integrated help menu to help you find your way. The programme is in English and German, and you can switch between the languages whenever you like. You can print out any important information and take it along on your trip.
